Megabox Inc manufactures color television sets and video cassette recorders (VCRs). It exports to the blooming market in Zumburu, one of the largest Middle Eastern markets. The company has a problem finding space in cargo airlines serving Zumburu.

There are a number of shipping services that company distribution manger is considering to solve the problem of not enough space available. Scheduled air cargo flights leave three times a week and could carry $3000 \mathrm{ft}^{3}$ per week. Another 12-month air transportation contract is being offered to the company that would provide the extra needed space at $10 \%$ discount but requires a commitment of at least $4000 \mathrm{ft}^{3}$ per week during the contract period.

By sea the weekly conference container vessel offers all needed space but he is limited to shipping in 40 foot equivalent unit (FEU) container loads (CL) or in less than container load (LCL). A ship operator who is out of the conference offered a semimonthly container service to Zumburu using 20 FEU containers at a $15 \%$ discount over the conference freight rates.

Estimates for next year sales are prepared by marketing department that is discounted by $10 \%$ and used make predictions for transportation costs. It is found that average Shipping Volume of all products per week is $7077 \mathrm{ft}^{3}$. This is higher than the minimum required in the twelve month contract. It is concluded that twelve-month contract limitation of $4000 \mathrm{ft}^{3}$ is not a problem unless the government of Zumburu imply limitations on imports. Given that the government of Zumburu is a member of the World Treaty Organization (WTO) it is not expected that it will apply any limitations on its imports in accordance to GATT agreement on free trade. It is concluded that there is no damage to the company under the $4000 \mathrm{ft}^{3}$ of minimum volume per week restriction.

Transportation cost is determined by volume and weight of shipment. It is found that transportation costs of Conference Containers (CL) are cheapest costs at \$34,678 which is $47 \%$ of transportation costs of Scheduled Air of $\$ 74310$. Other costs and discounts are included in transportation cost that varies for each transportation method. It is found that other costs and discounts are cheaper for scheduled air and the twelvemonth air contract at $\$ 2,933$. However other costs and discount on sea transported products only account $3 \%$ of total shipping costs by air. Thus other costs and discounts is not considered significant in determining the best shipment method to utilize. Storage costs which are dependent on days of storage at destination port are most expensive for scheduled air method at $\$ 12,837$ and cheapest for sea conference container ships at \$1,497.

Total Shipping costs are also estimated on marketing sales forecasts discounted at $10 \%$. Cheapest costs are for sea conference containers (CL) at a weekly cost of $\$ 46,145$.

Highest total shipping costs per week are for scheduled air at a cost of $\$ 90,079$. The twelve-month deal provides total shipment costs of $\$ 82,648$.

It is concluded that sea conference containers CL 40 FEU are the most cost effective method to transport products of Megabox, Inc. The $15 \%$ discounted out of conference LCL 20 FEU containers are more expensive than sea conference containers at a total value of transportation costs of $\$ 59,477$. The time for the shipment to arrive to its destination by Conference Containers (CL) is the longest time to arrive its destination. This could be adjusted by early shipment of products in anticipation of expected sales of Megabox Inc. Other than the total costs of shipment, the twelve-month contract is not selected due to the concerns about erratic changes in demand and possible government action in the government of Zumburu.

The following four methods of shipping are compared: Scheduled Air, Sea Conference 40 Foot Equivalent Unit (FEU) container loads (CL), non-conference 20 FEU less than container load (LCL), and the twelve-month Air contract. By comparing the shipping costs for each method it is found that
